

## **BDD Tests For App**

- 1) As a User I would like to view the different types of foods available so that I can quickly access what I want.

Scenario:

Given the User is on the Main Page, when they click one of the three different types of foods (Starters, Mains or Drinks), they will be directed to the correct page that the user wants to go to.

- 2) As a User I would like to review my food choices so I can edit my basket in case I have made mistakes.

Scenario:

Given the User has added items to their basket, when they click on the basket icon in the top right corner from the main page, they are directed to the basket page where they can view items and remove items from their basket by clicking on the item no longer wanted and pressing 'Yes' to the pop up message displayed asking if you would like to remove the item.

- 3) As a User I would like to make multiple orders so that other people can also use the same device and place their order from it.

Scenario:

Given the User has added items to their basket, when they click on the basket icon in the top right corner from the main page, they are directed to a basket page where they can place the order by pressing the 'Place Order' button and the placed order items are cleared from the basket, while the page automatically redirects to the main page ready for another order.
