BDD Tests For GUI

1) As a User I would like to be notified if my credentials are incorrect as I try to login to the database so that I can retrieve the correct ones.
   Scenario:
   Given the user is on the Login window, when they type in their username and their password into the fields and press the 'Login' button, they will be alerted with a pop up message indicating whether or not their credentials are wrong.

2) As a User I would like to be notified if my login was successful so that I know I am connected to the database.
   Scenario:
   Given the user is on the Login window, when they type in their user("user") and password("password) into the field, they will be alerted with a pop up message indicating the login was successful which will be followed by a database page.

3) As a User I would like to view the information already in the database so that I can avoid adding duplicate rows of data.
   Scenario:
   Given the user is on the Db window, they will be able to view a table of data from the database showing all its entries.

4) As a User I would like to view the information already in the database so that I can delete what is no longer required.
   Scenario:
   Given the user is on the Db Window, they will be able to view a table of data from the database. When they select a row of data from the table and click delete, the row selected will be removed.

5) As a User I would like to be able to view the information already in the database so that I can add the data that is still left to be added.
   Scenario:
   Given the user is on the Db Window, they must input the text fields for 'Name' and 'Department' and then click on the 'Add' button. This will add the data to the database and show on the table.
